### Question No. 1

A developer created an enterprise application which contained data source and security role information. The developer asked a system administrator to install this application to an application server where global security is enabled using the Integrated Solutions Console (ISC). A new data source was configured at the server scope for the use of this application. While load testing the application, the developer noticed that the attributes configured on the new data source were ignored by the application server.

How can the administrator ensure that the attributes configured on the new data source are used by the application server?

- **A.** Create the data source under cell scope instead of server scope.
- **B.** Delete any data source of the same name defined under node, cluster or cell scope.
- **C.** Reinstall the application and clear the Process embedded configuration check box.
- **D.** Correct the component-managed and container-managed authentication aliases set on the data source.

**Answer: C**

### Question No. 2

After installing an enhanced EAR in a WebSphere Application Server environment, a system administrator with Configurator privileges is able to see a JDBC provider and a data source in the Integrated Solution Console (ISC) but is not able to delete these resources.

How can the administrator resolve this issue?

- **A.** Use the AdminTask object to delete the resources.
- **B.** Stop all application server instances and then delete the resources.
- **C.** Ask another administrator with iscadmin privilege to delete the resource.
- **D.** Edit the EAR to remove the application scoped resources and reinstall the application.

**Answer: A**

### Question No. 3

A system administrator has configured a cluster containing 40 servers. The cluster members all belong to one core group. While examining the log files, the administrator notices that the core group coordinator is consuming abnormally high amounts of memory and CPU resources.

How can the system administrator reduce the memory and CPU resource usage of the core group coordinator?

- **A.** Configure a core group bridge.
- **B.** Configure a second active coordinator.
- **C.** Decrease the memory on the machine.
- **D.** Move the coordinator to another machine.

**Answer: B**

### Question No. 4

A system administrator needs to configure a JDBC provider and a data source for an application in a

clustered environment. The administrator also needs to copy the JDBC drivers from the database server to the application server machines.

How can the administrator meet these requirements?

- **A.** Create a JDBC provider and the data source in the cluster scope. Copy the driver to all nodes. Set the environment variable at the node level to the driver's path.
- **B.** Create a JDBC provider in the server scope and the data source in the node scope. Copy the driver to all application servers. Set the environment variable at the node level to the driver's path.
- **C.** Create a JDBC provider in the node scope and the data source in the cell scope. Copy the driver to the deployment manager. Set the environment variable at the server level to point to the deployment manager path.
- **D.** Create a JDBC provider in the application scope and the data source in the server scope. Copy the driver to all application server directories. Set the environment variable in each JVM to the driver's path.

**Answer: A**

### **Question No. 5**

The administrator needs to identify any security role references and security constraints in a web application.

How can the administrator identify these roles and constraints?

- **A.** ibm-application-ext.xml file using a text editor.
- **B.** ibmconfig folder in the application after using the EARExpander command.
- **C.** Web deployment descriptor using IBM Assembly and Deploy Tools.
- **D.** Security role to user/group mapping by using the Integrated Solutions Console (ISC).

**Answer: C**
